

1.4) Two kilograms of air at an initial temperature and pressure of 30°C and 100 kPa undergoes an isentropic process, the final temperature attained being 850°C. Find the final pressure, the initial and final densities, and the initial and final volumes.

Solution:

Given: $m = 2$ kg, $T_1 = 30^\circ\text{C} = 303$ K, $p_1 = 100$ kPa, isentropic process, $T_2 = 850^\circ\text{C} = 1123$ K

To calculate: $p_2 = ?$, $\rho_1 = ?$, $\rho_2 = ?$, $v_1 = ?$, $v_2 = ?$.

Using isentropic relation, with $\gamma = 1.4$ for air,

$$\frac{p_2}{p_1} = \left(\frac{T_2}{T_1} \right)^{\gamma/(\gamma-1)}$$

$$p_2 = p_1 \left(\frac{T_2}{T_1} \right)^{\gamma/(\gamma-1)}$$

$$p_2 = 100 \times 10^3 \times \left(\frac{1123}{303} \right)^{1.4/(1.4-1)}$$

$$\boxed{p_2 = 9801.216 \text{ kPa}} .$$

The density ρ_1 can be calculated using the ideal gas equation as,

$$\rho_1 = \frac{p_1}{R T_1} = \frac{100 \times 10^3}{287 \times 303}$$

$$\boxed{\rho_1 = 1.15 \text{ kg/m}^3} .$$

The density ρ_2 can be calculated using the ideal gas equation as,

$$\rho_2 = \frac{p_2}{R T_2} = \frac{9801.216 \times 10^3}{287 \times 1123}$$

$$\boxed{\rho_2 = 30.41 \text{ kg/m}^3} .$$

Since the mass is constant $m = 2$ kg, the volumes can be calculated as,

$$\boxed{v_1 = \frac{m}{\rho_1} = \frac{2}{1.15} = 1.73913 \text{ m}^3}$$

$$\boxed{v_2 = \frac{m}{\rho_2} = \frac{2}{30.41} = 0.0657678 \text{ m}^3}$$
